

POSTDOC POSITION ON QUANTUM DOT PULSED LASERS ON A CHIP

Ghent University – IMEC, Photonics Research Group
Tech Lane Ghent Science Park – Campus A
Technologiepark – Zwijnaarde 15, B-9052 Gent, Belgium

Optical Frequency combs are lasers which produce thousands of equidistant laser lines. The frequency spacing between these lines lies within the radiofrequency band of the electromagnetic spectrum, while the frequency of the laser lines itself lies in the optical part of the electromagnetic spectrum. This provides a link between the RF and the optical domain. They act as “spectral rulers” against which unknown optical frequencies can be measured, and they have had a revolutionary impact on numerous fields ranging from the detection of extra-solar planets to precision metrology, winning its inventors a Nobel Prize in 2005.

Traditionally, these optical frequency combs have been constructed with the help of ultra-short Titanium Sapphire lasers and fiber lasers. In bulky experimental setups these sources have been used to measure distances with an extreme precision, as a critical tool to make the next generation optical clocks, as a source in attosecond pulse generation experiments, telecom sources for Tbit/s transceivers, ... However, for most of the real-life applications these lasers are not practical, they are too large, too expensive. That is why there has been an enormous interest in the development of on-chip optical frequency combs. Preferably such integrated sources are made using CMOS compatible fabrication processes. Very recently, the Photonics Research Group at Ghent University has shown integrated mode-locked lasers on a silicon chip. These results have been published in [Nature Light: Science & Applications](#) and highlighted in [Nature Photonics](#). Here we want to make mode-locked lasers on silicon nitride chips that will be used to make integrated optical clocks. The work will be done in the context of the European pathfinder project (CSOC) in collaboration with academic institutions such as EPFL in Switzerland and DTU in Denmark as well as industrial partners

JOB DESCRIPTION:

Building further on the first results obtained at Ghent University a new generation of mode-locked lasers will be developed in this postdoc-project. Here we will make use of the fundamental ultra-fast nonlinear response of the waveguides on the silicon chip. Inspired by the ultra-short pulsed fiber mode-locked lasers we will target a new generation of ultra-short pulsed lasers on chips with pulses as short as 100 fs.

ABOUT THE PHOTONICS RESEARCH GROUP:

The Photonics Research Group (about 85 people) is associated with IMEC, and is part of the Department of Information Technology of Ghent University. The group is headed by Prof. Dries Van Thourhout and has been active in photonics device research for many years. The other professors in the group are Roel Baets, Peter Bienstman, Wim Bogaerts, Stephane Clemmen, Bart Kuyken, Nicolas Le Thomas, Yanlu Li, Geert Morthier, Gunther Roelkens and Kasper Van Gasse. The main research directions are silicon nanophotonics, heterogeneous integration, optical communication, photonic (bio)sensors and photonic integrated circuits for biomedical applications in the near-infrared and mid-infrared wavelength range. More in particular, the silicon nanophotonics work focuses on the design and fabrication of SOI-based photonic devices using standard lithographic techniques compatible with CMOS-processing.

The Photonics Research Group has been coordinating the network of excellence ePIXnet and is involved in a number of EU-projects, including the H2020 projects ActPhast4R, AQUARIUS, CALADAN, FUN-Comp, Hydroptics, InSiDe, INSPIRE, MedPhab Pilot Line, MIRPHAB Pilot Line, PIX4Life Pilot Line, MORPHIC, NEBULA, Neoteric, TopHit and PhotonHub. The group also host two EOS Research projects, INTERREG projects and several ITNs (MICROCOMB, OMT, WON, Phonsi). Furthermore, the group is partner of the Center for Nano- and Biophotonics of Ghent University and leads ePIXfab, the European Silicon Photonics Alliance.

The group has been awarded five ERC Independent Researcher Starting Grants, one ERC Consolidator Grant and two ERC Advanced Investigator Grants.
